TEAM NAME

AlgoSapiens

Problem Statement

E-commerce businesses manage inventory, orders, support, pricing, marketing, and logistics across different systems, making operations difficult to manage efficiently.

This results in:

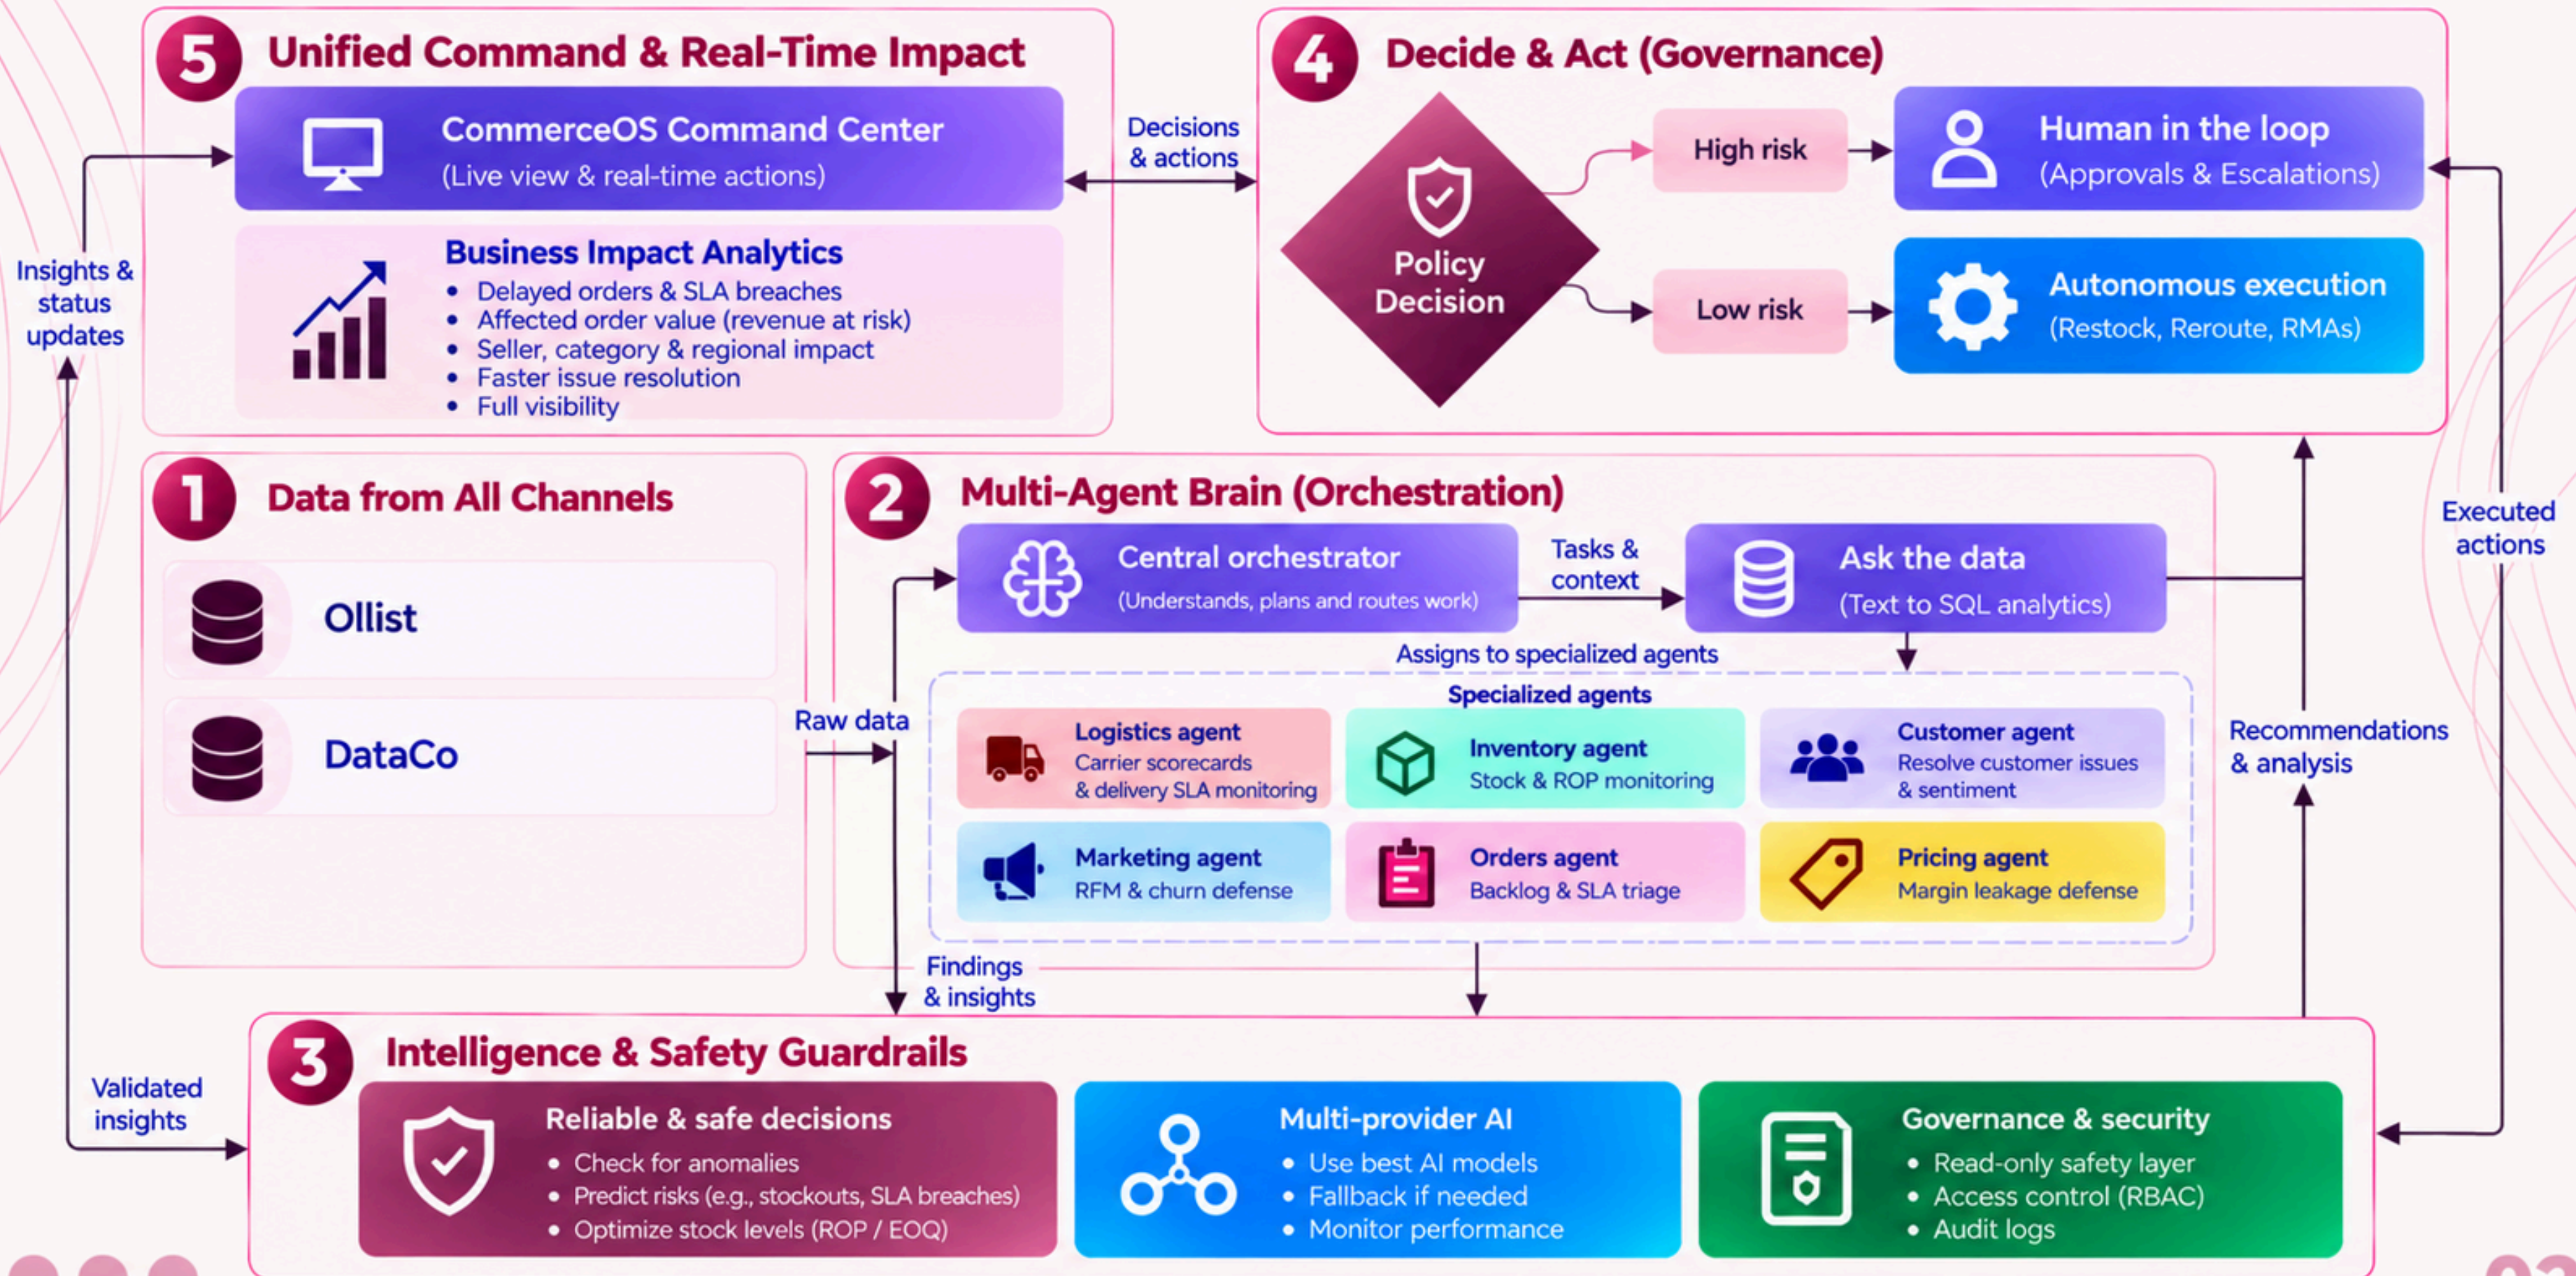

- Delayed identification of operational issues
- Stockouts and excess inventory
- Order processing and fulfillment delays
- Slow customer support
- Poor coordination between business functions
- Lost revenue due to reactive decision-making

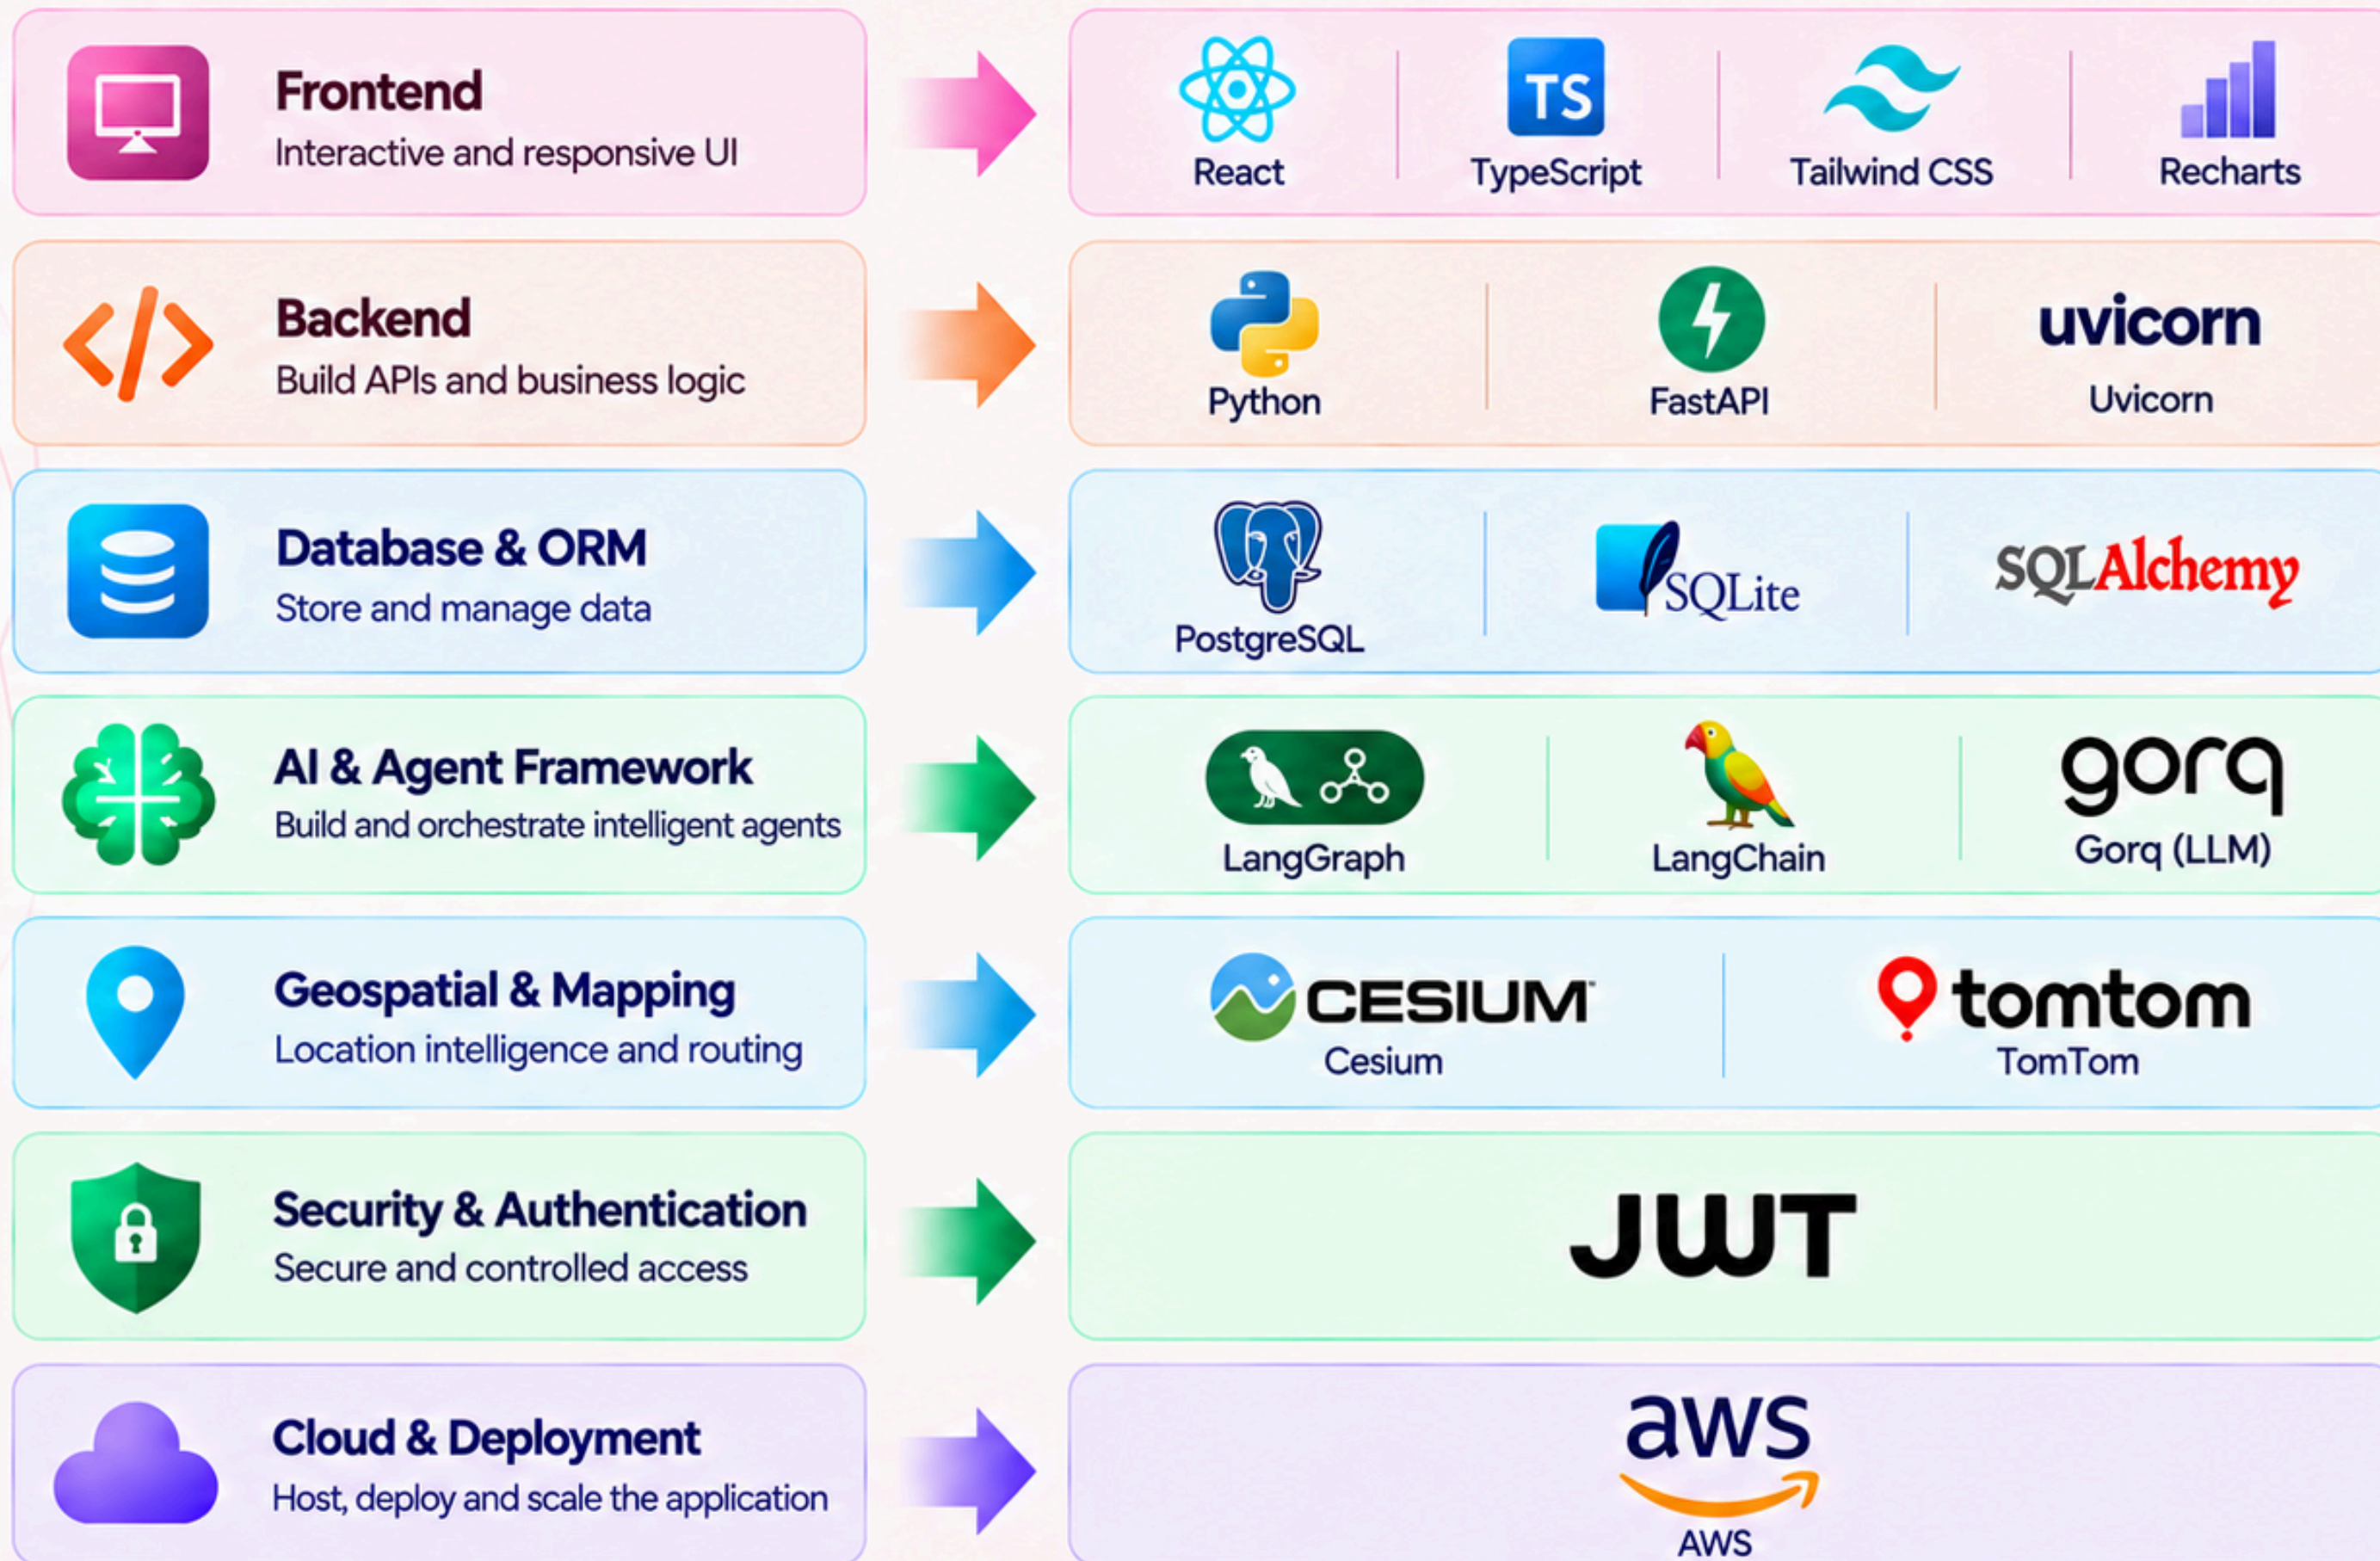

Core Challenge

Build an AI-powered multi-agent platform that can continuously monitor e-commerce operations, identify problems, make informed decisions, and automate actions across the entire business workflow.

Proposed Solution

TECH STACK

Key Features

01

Conflict-Free Decisions

Agents negotiate, not compete.

- Auto-resolves conflicts across Pricing, Inventory, Marketing, etc.
- Prevents stockouts & campaign clashes
- One coordinated plan for the whole business

02

Numbers You Can Trust

LLM for language. Math for logic.

- LLM only understands intent
- Deterministic Python/SQL for all calculations (ROP, EOQ, anomaly detection)
- No hallucinations. Real numbers.

03

Smart Logistics Mapping

Cesium + TomTom for real-world delivery.

- Cesium 3D map for end-to-end visualization
- TomTom for routing, distance & ETA
- Track shipments from warehouse to customer using live coordinates

CommerceOS

04

Safe Autonomy

Automation with guardrails.

- Auto, Approve or Block actions
- Human approval for high-impact tasks
- Role-based access control

05

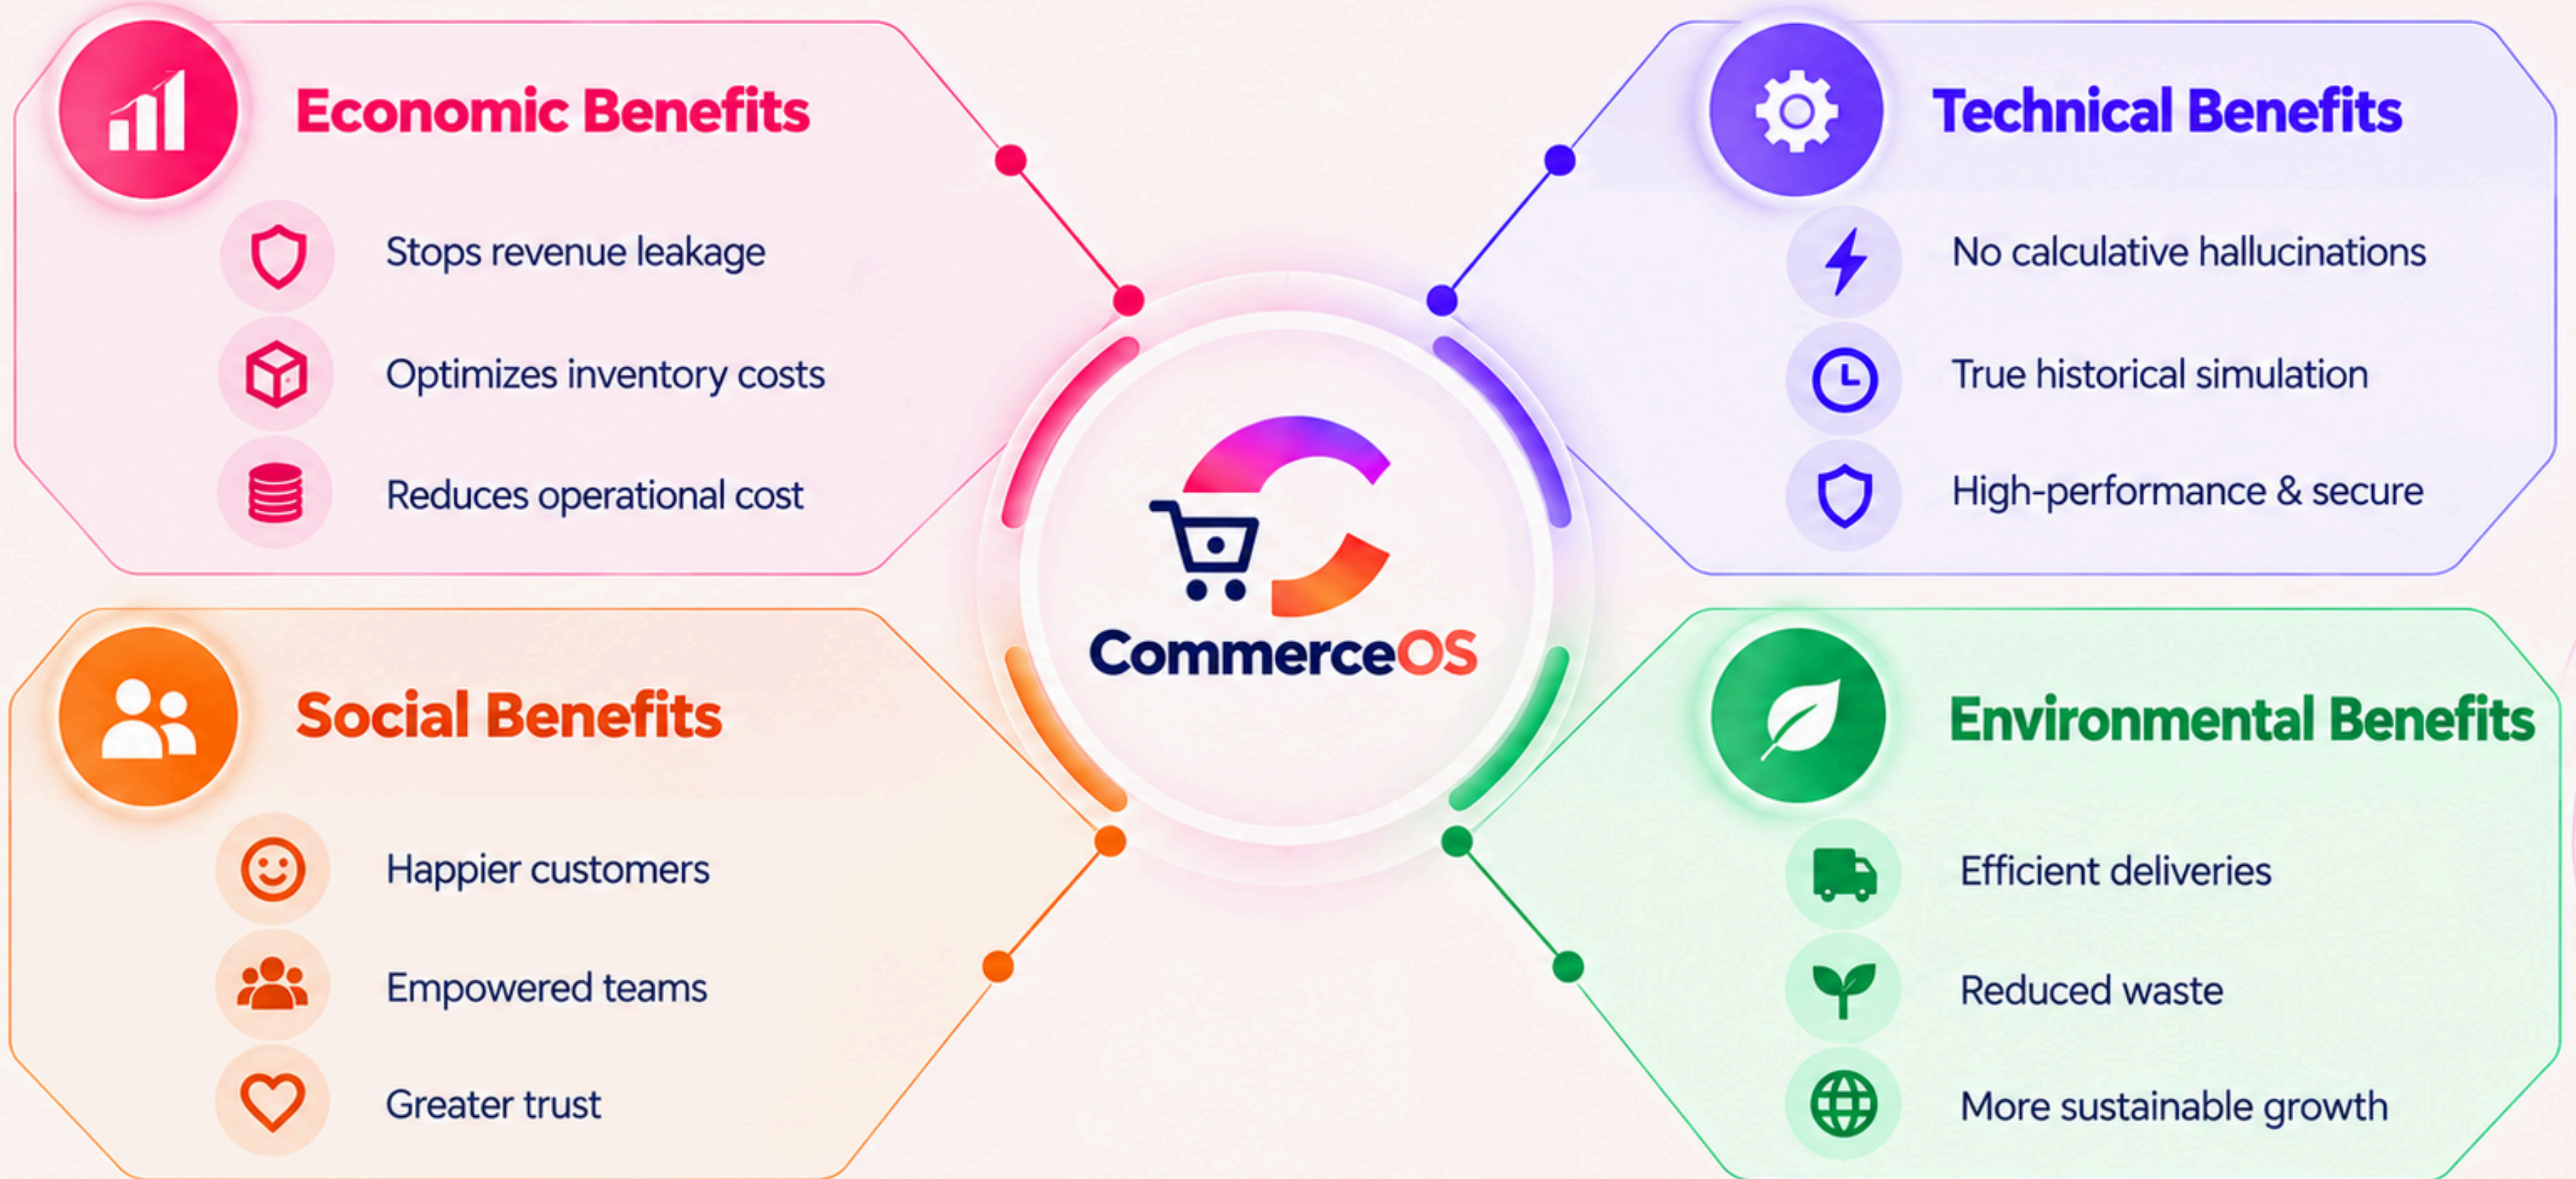

Intelligent Report Generation

From data to decisions, instantly.

- Auto-generate business, SLA & operational reports
- Custom reports via natural language (Text-to-SQL)
- Export and schedule reports (PDF/CSV)

BENEFITS

THANK YOU
